

CB U3.5: Boolean Expression

Boolean Values

Booleans are always evaluated to `True` or `False` statements. Booleans variables are either true or false. Relational operators compare two values. `MOD 2 == 0 ->` number is even

Operators

Boolean expressions can be combined with the `and`|`or` operators.

`A and B` *# true only when both are true*

`A or B` *# true when atleast one is true*

Boolean expr can be negated with `not`

`not False == True`
